About

I'm a backend developer who genuinely enjoys turning real-world challenges into well-designed, usable products that people can actually benefit from. Beyond just making things work, I care deeply about software engineering principles — writing code that is structured, maintainable, and built to last. I believe the best work happens in collaborative environments where teammates support each other, share knowledge openly, and genuinely enjoy the process. Currently open to new opportunities and excited to join a team where I can grow, contribute, and help build something meaningful together.

Technical Skills

Languages & Web: JavaScript, TypeScript, Node.js, HTML5, CSS3, EJS, Handlebars

Frameworks & APIs: NestJS, Express.js, GraphQL (Basics), RESTful APIs, Swagger

Databases & Data Layer: PostgreSQL, Redis, MongoDB, MySQL, Prisma, TypeORM, Sequelize, Mongoose

Architecture & Messaging: Event-Driven Architecture, Modular Monolith, Microservices (Basics), Message Brokers (RabbitMQ, Redis Streams), System Design

Real-Time Systems: WebSocket (Socket.IO)

DevOps & Tooling: Docker, Git, GitHub Actions, Amazon S3, Linux / Bash

Testing & Quality: Unit Testing (Jest, Vitest), Integration Testing (Supertest), API Testing

Professional Experience

Backend Developer — *Dec 2025 – Apr 2026*
Droplinked — *Abu Dhabi, UAE | Remote*

- Migrated legacy services to a modular NestJS architecture, refactoring core business logic for long-term maintainability.
- Designed and structured relational database schemas with indexing and data integrity constraints.
- Developed and deployed new product features end-to-end and resolved critical production bugs to improve system stability.

Node.js Intern — *Jun 2024 – Sep 2024*
Robintel — *Isfahan, Iran | On-Site*

- Built backend services with Express.js, implementing routing, middleware pipelines, and RESTful API endpoints following team conventions.
- Collaborated with the product team to design application flows and database schemas for new feature development.
- Practiced Git-based workflows including feature branching, pull requests, and code reviews in a team environment.

Projects

SyncBoard – Real-Time Collaborative Workspace — GitHub
TypeScript, NestJS, PostgreSQL, Prisma, Redis, RabbitMQ, Socket.IO, Yjs, Docker, Jest, Nginx

- Designed and built the backend of a Trello/Notion-style workspace (Kanban boards, cards, collaborative documents) as a NestJS modular monolith with decoupled domain modules communicating via domain events, ready for microservice extraction.
- Implemented real-time document editing with Yjs (CRDT) over Socket.IO with debounced PostgreSQL persistence and snapshot versioning; scaled WebSockets horizontally with the Redis adapter and built Redis-based presence tracking.
- Optimized PostgreSQL: monthly range-partitioned audit log, partial/composite indexes, and LexoRank ordering for single-row card reordering.
- Built async processing on RabbitMQ with dead letter exchanges, exponential-backoff retries, and Redis-backed idempotent consumers.
- Implemented RS256 JWT auth with rotating refresh tokens and reuse detection, Redis token blacklist, Google OAuth, multi-tenant RBAC, Redis rate limiting and idempotency keys, and presigned S3 uploads.
- Wrote 1,200+ unit tests (100% coverage), containerized the stack (Nginx, PgBouncer, read replicas), and built a React client to demo the backend.

HamBaar – Package Delivery Platform GitHub

TypeScript, NestJS, PostgreSQL, Prisma, Redis, AWS S3, Docker, GitHub Actions, Jest, Turf.js

- Led product definition and backend design of a platform matching package senders with transporters, covering the full flow: package and trip creation, matching, delivery requests, tracking, and wallet with escrow and commission settlement.
- Built the matching engine using geospatial route-corridor analysis (Turf.js, Neshan Maps API) with capacity checks and ranking, plus a configurable dynamic pricing engine (distance tiers, weight, special handling, route deviation).
- Implemented multi-stage SMS OTP authentication with scoped JWTs (temporary, progress, access), RBAC, Redis sessions, OTP rate limiting, and presigned S3 uploads with size limits.
- Set up unit, integration (real PostgreSQL and Redis), and e2e tests (600+ unit tests, ~92% coverage) and a CI/CD pipeline deploying Docker images automatically.

MenuChi – No-Code Menu Builder GitHub

TypeScript, Express.js, Prisma, PostgreSQL, Redis, AWS S3, TSOA, Docker, Vitest

- Built the backend of a no-code restaurant menu platform: a reusable item backlog and day-based menu publishing across a multi-tenant hierarchy (restaurant, branch, menu), plus customer ordering with status tracking.
- Implemented owner auth (session + JWT with scope-based permissions) and customer email-OTP login with rate limiting.
- Integrated external image-processing and OTP services via Redis Streams, and presigned S3 uploads for menu images.

Bookstore API GitHub

TypeScript, NestJS, TypeORM, MySQL, Redis, Docker, Jest

- Designed a normalized MySQL schema modeling titles, physical editions, authors, translators, publishers, tags, characters, collections, orders, and more, with TypeORM migrations and seeders.
- Built the e-commerce flow: carts, percentage/fixed discount codes, and orders with price snapshots and atomic conditional stock updates to prevent overselling under concurrent requests.
- Implemented session-based auth (Redis) with role guards (customer, staff, publisher, admin), plus non-blocking Redis view tracking and trending content.
- Built reviews with replies and emoji reactions, bookmarks, blogs, and support tickets, with event-driven staff audit logging, health probes, and Swagger docs.

Education

Bachelor of Science in Computer Engineering *2021 – 2025*

University of Isfahan

Additional

Languages: English (Professional Working Proficiency) | Persian (Native)

Soft Skills: Team Collaboration, Ownership & Responsibility, Fast Learner, Adaptability
